Adhering To Fiscal Deficit Target

What is the issue?

\n\n

\n
- India is witnessing a sharp deceleration in economic growth.
\n
- Fiscal stimulus is being touted as a policy measure to revive the economy.
\n
- However, a deeper understanding in terms of 'fiscal deficit' reveals why fiscal stimulus is not the right option.
\n

\n\n

Why a slowdown in economy?

\n\n

\n
- There were many transient factors like the GST and demonetisation impacts for the current slowdown.
\n
- But besides these, one of the prime reasons is the steady and sharp **decline in the investment rate**.
\n
- Notably, public investment in recent years has shown a small rise.
\n
- So the lowering investment rate has largely been due to the **decline in the private investment rate.**
\n
- The Gross Fixed Capital Formation (GFCF) rate has come down in the recent quarter.
\n

\n\n

Why not a fiscal stimulus?

\n\n

\n
- A fiscal stimulus is one in which the government spends more from its own pocket or slashes tax rates to boost a sluggish economy.
\n
- This results in more money in the hands of consumers, and as a result spending goes up, thereby encouraging demand and growth.
\n
- There are opinions that a strong fiscal stimulus through an increase in **public investment** and a **relaxation on the fiscal deficit** obligation is needed.
\n
- However, an understanding of the real factor behind slowdown as said above, demands policy initiatives for raising the **private investment.**
\n

\n\n

Why is relaxing fiscal deficit target risky?

\n\n

\n
- **Borrowing space** - The prime focus of fiscal deficit targeting is to ensure that the private sector has sufficient borrowing space.
\n
- Increasing government debt and increasing interest rates reduces the credit available for businesses.
\n
- Also, government selling its securities, such as Treasury bonds to finance its debt absorbs the available funds from the private sector.
\n
- So, widening fiscal deficit would only narrow the borrowing space and reduce private investment at a time when it has to be boosted.
\n
- **Debt-GDP ratio** - Government has set a target of debt-GDP ratio at 60% in 2023 from the present level of 70% .
\n
- This requires the Centre and States to contain their debt-GDP ratios at 40% and 20%, respectively.
\n
- This is achievable only by limiting the fiscal deficit at 3% of GDP in the first three years and 2.5% in the next two years by the Centre and States.
\n
- **Revenue deficit** - Over 60% of the estimated fiscal deficit at the Centre in

2017-18 (1.9% out of 3.2%) is revenue deficit.
\n

- At the State level also , the revenue deficit is only expected to increase.
\n
- This is because of the impact of loan waivers, additional interest payments on account of UDAY scheme, and pay revision as per 7th pay commission.
\n
- Given all these, any additional fiscal stimulus measures would only widen the already increasing revenue deficit.
\n

\n\n

What lies ahead?

\n\n

\n

- India's economic history is replete with adverse effects of fiscal expansion on inflation as well as the balance of payments.
\n
- The huge fiscal expansion in the late 1980s and 2008-09 have led to some serious economic crisis besides the benefits.
\n
- Clearly, the solution to the current slowdown in growth lies in:
\n

\n\n

\n

i. reviving private investment.
\n
ii. recapitalising banks to enable them to lend more.
\n
iii. speedy completion of stalled projects.
\n

\n\n

\n

- The fiscal deficit rules evolved are consistent with the level of savings and the demands of the various sectors on those savings.
\n
- So, fiscal prudence is crucial for sustaining growth over an extended period.
\n
- In this challenging economic situation, any aggressive attempt to widen the fiscal deficit would only worsen India’s economic problems.
\n

\n\n

Quick Facts

\n\n

Fiscal Deficit

\n\n

\n
- Fiscal deficit is the difference between total revenue and total expenditure of the government.
\n
- It is an indication of the total borrowings needed by the government (so as to finance the deficit).
\n
- Fiscal deficit takes place either due to revenue deficit or a major hike in capital expenditure.
\n

\n\n

Gross Fixed Capital Formation (GFCF)

\n\n

\n
- Gross fixed capital formation is essentially the net investment.
\n
- GFCF refers to the net increase in physical assets (investment minus disposals) within the measurement period.
\n
- It does not account for the consumption (depreciation) of fixed capital, and also does not include land purchases.
\n
- It is a component of the Expenditure method of calculating GDP and measures the net increase in fixed capital.
