

Balancing the Balance of Payment

What is the issue?

\n\n

\n

- New RBI data on India's Balance of Payments for 2017-18 was released recently.
- With CAD expected to widen, it is essential to assess the overall Balance of Payments (BoP) position of India.

\n

\n\n

What does the data reveal?

\n\n

\n

- **CAD** - The RBI data show current account deficit (CAD) at around \$48 bn.
- This is the highest since the record \$88 bn of 2012-13.
- CAD is expected to widen to \$75 bn during this fiscal.

\n

\n\n

\n

- **Forex** - India's forex reserves stands at around \$424 billion as on March 2018.
- This is actually the eighth largest in the world.

\n

\n\n

What does it imply?

\n\n

- \n
- The current reserves can finance 10.9 months of imports.
- \n
- This is better when compared to 7.8 months in March 2014.
- \n
- The RBI's current forex war chest is clearly sufficient.
- \n
- This can meet the immediate import needs.
- \n
- It could also keep away currency value fluctuations.
- \n
- Given these, any anticipation of a "crisis" position is highly misplaced.
- \n

\n\n

What then is the concern?

\n\n

- \n
- **Countries generally** accumulate reserves by exporting more than importing.
- \n
- IMF data on the current account balances reveals this nature.
- \n
- Top 10 forex reserves holders have been running surpluses year after year.
- \n
- This is however barring India and Brazil.
- \n
- **India** has always had deficits on its merchandise trade account.
- \n
- Its value of imports of goods is far in excess of that of exports.
- \n
- However, India has traditionally enjoyed a surplus on its 'invisibles' account.
- \n
- Invisibles basically cover receipts from export of software services.
- \n
- Inward remittances by migrant workers, and tourism also form part of this.
- \n
- On the other side, it includes payments towards interest, dividend and royalty on foreign loans, investments and technology/brands.
- \n
- Besides it includes payments on banking, insurance and shipping services.
- \n
- However, invisibles surpluses have not largely exceeded trade deficits.
- \n

- This has resulted in the country consistently registering CADs.

\n

\n\n

How has India been managing this deficit?

\n\n

\n

- India and Brazil represent unique cases of economies that have built reserves.
- This was largely on the strength of the capital rather than current account of the BoP.
- Thus, India has been managing these years with CADs, and still accumulating reserves.
- This is because foreign exchange comes not only from exporting but also from capital flows.
- It could be by way of foreign investment, commercial borrowings or external assistance.
- For most years, net capital flows into India have been more than CADs.
- The **surplus capital flows** have, then, gone into building reserves.

\n

\n\n

Is this a sustainable model?

\n\n

\n

- It is to be noted that there have also been years with reserves depletion.
- This was due to net capital inflows not being adequate to fund even the CAD.
- Expecting foreign capital to bridge the gap between exports and imports would not be ideal.

\n

\n\n

How does the future look?

\n\n

\n

- **CAD** - The CAD fell sharply from 2012-13 to 2016-17.
- This was mainly because of India's oil import bill nearly halving.
- However, in 2017-18, the CAD has risen due to resurgent global crude prices.
- Furthermore, CAD is expected to cross \$75 billion this fiscal.
- **Inflows** - There are signs of capital flows slowing down as well.
- Foreign portfolio investment in India also reflects the larger sell-off pattern across emerging market economies.
- This is primarily in response to profitable rising interest rates in the US.
- The Swiss investment bank Credit Suisse's has forecasted on net capital flows to India for 2018-19.
- Being \$55 bn, it is far lower than the projected CAD of \$75 bn.
- **Reserves** - Eventually, forex reserves may decline for the first time since 2011-12.
- The RBI's data already show the total official reserves as in June at \$413.11 bn.
- This is a dip of around \$ 11 bn over the level of end-March 2018.

\n\n

How to deal with it?

\n\n

\n

- Favourable growth prospects are essential to attract capital flows to fund CADs.
- The investment environment of the country should also be conducive.
- Notably, it is better if these investments go towards augmenting the economy's manufacturing and services export capacities.

\n

- This, instead of simply producing or even importing for the domestic market, would be better.

\n

- In the long run, this can help narrow the CAD to more sustainable levels.
