Coal Shortage Re-emerges

What is the issue?

- Despite last year’s assertion by the government that the era of coal shortage is over, most power plants are currently facing shortages.
- Systemic shortcomings in both demand and supply-side management are hence apparent, which needs to be addressed.

What is the current scenario in the sector?

- The union power minister stated in 2017 that except for a few power plants along the coast, India didn’t have to import coal for the foreseeable future.
- It was thought that shortages will no longer creep up as ‘Coal India Limited’ (CIL), which produced the bulk of coal within India, stepped up production.
- But this transformation turned out to be short-lived, with many coal-based power plants in the country going almost out of stock recently.
- **Enhanced Demand** - While it is difficult to point to a single reason, enhanced demand for coal is regarded as one of the primary reasons.
  - Thermal power production increased by more than 4% in the last 2 quarters and coal imports have risen despite a 40% jump in international prices.
  - Also, e-auction prices for coal have risen and the premium rose 76% in Q3 of FY18 as against 24% in the same period last year.

What are the other specifics?
• **Logistics** - Poor rail links from the mines, insufficient loading infrastructure and non-availability of rakes, are other aspects that continue to persist.

• Notably, all the 20 power plants that have critical coal stock levels are non-pithead plants (away from mining zones).

• This is hence also a classical case of inventory mismanagement by both Coal India and the power plants.

• **Market Fluctuations** - Domestic supply from CIL did rise initially, it then moderated to a mere 1.6% average rise in the last 6 months of 2017.

• This was because, while CIL was increasing production, the Indian economy plummeted and hence there was a slower increase in demand for electricity.

• Significantly, in 2016-17 the plant load factor of thermal power plants fell below 60% (lowest in a decade), which consequently, saw coal stocks piling up.

• As CIL closed FY16-17 with a massive 68 million tonnes of stock, it began to cut back on production to clear older stocks.

• But when the demand picked up suddenly in recent months, it wasn’t able to ramp up supply at the expected rate.

---

**What needs to be done?**

• As 66% of the country’s electricity generated from coal, shortages tend to prove costly, for the industry, economy and public at large.

• The need for improving productivity, infrastructure and the financial position of power utilities is a long standing one and needs to be improved.

• The latest episode of shortage points to the need for a technology-driven system that enables better prediction of demand swings.

• This would help both coal producers and consumers to react faster and recalibrate their actions appropriately.
