

Coal - The Indispensable

What is the issue?

\n\n

As socio-political & economic realities do not favour the prospects of renewable, an out of the box thinking for policy making is needed.

\n\n

How does the energy scenario look?

\n\n

\n

- All major studies agree that coal is a dirty fuel and to tackle the problem of climate change, the government must exponentially increase the generation of renewables.

\n

- But they also agree that renewables cannot replace coal as the bulwark of the energy system in the foreseeable future.

\n

- Studies estimate that even by 2040, fossil fuels (coal, oil, gas) will together continue to contribute between 70 to 80% of our primary energy requirements.

\n

- As coal offers the cheapest source of energy, electricity infrastructure is built around this fuel.

\n

- Alternatives are not competitive enough and politicians & labour unions make it more difficult to substantively replace this fuel.

\n

\n\n

How is the problem on the pollution front?

\n\n

- 13 of our cities rank amongst the most polluted in the world and India is touted to soon overtake China as the world leader in number of deaths caused by respiratory illness.
- Our per capita energy consumption is 521 kgs of oil equivalent currently and is expected to more than double by 2040.
- Nearly a billion people would be looking at internal combustion engines for mobility, which will drastically aggravate pollution.

What has been the evolving policy scenario?

- **The studies** - All major studies have emphasised the importance of pushing India onto a low carbon pathway.
- Most recommend the government to create an enabling ecosystems for augmentation of renewable energy and the development of clean energy technologies.
- **New Technologies** - The TERI/Shell report has outlined certain “horizon technologies” that warranted particular focus.
- These technologies as outlined were - 3rd generation bio-energy, advanced nuclear, coal gasification, geothermal, hydrogen fuel cells, high speed railways etc.
- **Coal’s Indispensability** - But notwithstanding the greatest of efforts to promote renewable, the studies predominantly conclude that coal will continue to dominate the energy sector.
- Also, the “Chief Economic Advisor - Mr.Subramanian”, in particular, cautioned against the hype on renewables.
- He pointed out that once the full cost of renewables are taken into

account, there is little prospect of renewables achieving cost parity with coal in the foreseeable future.

\n

- Even after considering the social costs of the GHG emissions emitted by coal, it seems to still hold its ground.

\n

\n\n

Can we afford to give up coal?

\n\n

\n

- India is the only Country where energy demand is expected to continuously rise.

\n

- A quarter of our population does not have access to electricity, 40 per cent still use firewood and dung for cooking and lighting.

\n

- Against this backdrop, giving up coal would be politically, economically and socially naive.

\n

- Hence, the government should augment coal production along with supporting renewable in order to meet the growing energy needs.

\n

\n\n

How can we best approach the future?

\n\n

\n

- While continuing to use coal, the best way is to be able to muster the courage to dream of a very different energy future.

\n

- Decision makers should engage with our energy sector with more radical imagination and break out of the conventional moulds.

\n
