

Dollarisation

Why in news?

Javier Milei, the recent winner of Argentina's presidential election, has drawn attention for his plan to replace the *country's currency "Peso"* with the dollar.

What is dollarisation?

• It is the process by which a country decides to <u>use two currencies</u> the local currency and generally a stronger, more established currency like the US dollar.

- **Occurrence-** It occurs in *developing countries* with a weak central monetary authority or an unstable economic environment.
- It usually happens when a country's currency becomes unstable or loses its value due to *high inflation* or other economic problems.
 - **Example** Zimbabwe ran a dollarization test to see if the adoption of foreign currency could reduce high inflation and stabilize its economy.
- Types- There are 4 types of dollarization that countries can adopt.

Types of dollarisation

Complete dollarisation

• It implies that foreign currency is the only legal tender in the country.

Partial dollarisation

• It implies that the foreign and local currencies are accepted as legal tender.

Official dollarisation

• It implies that the country's government and monetary authorities have accepted a foreign currency as its legal tender.

Unofficial dollarisation

• It occurs when the people in the country have their savings in foreign currency in the form of investment instruments.

What is the significance of dollarisation?

- **Economic stability** It can *lower inflation rates and stabilise prices*, as the dollar is less prone to devaluation and volatility than the domestic currency.
- **Promote investment** It can *avoid currency crises*, which reduces the sovereign risk premium and *lowers interest rates*, leading to higher investment and growth.
- **Boost trade-** It can *facilitate trade and integration with international markets*, as the dollar is stronger and more widely accepted than the domestic currency.
- **FDI destination** It can *encourage foreign direct investment (FDI)*, as investors do not need to worry about exchange rate risks or currency fluctuations.
- **Cost effective** It can *promote fiscal discipline* and a competitive financial system, as the government and the banks cannot rely on printing money to finance their deficits or bailouts.

3 fully dollarised economies - **Ecuador, Panama and El Salvador** have had successful economic outcomes following dollarisation.

Ecuador model of dollarisation

• **Price stability**- It helped the country to reduce inflation which was over 100% in 2000 to around 4% in following years.

• **Lower interest rate**- Interest rate declined making credit more affordable and encouraging investment and consumption.

• **Fiscal discipline**- It limited government's ability to finance its spending by printing money. This also improved the country's credit rating and reduced its country risk premium.

• The country used the oil revenues to increase social spending and reduce poverty and inequality.

What are the issues of dollarisation?

- **Monetary autonomy** It can reduce the country's monetary autonomy, which means it cannot adjust its money supply or interest rates according to its economic needs.
 - $\circ\,$ Greece benefited from using the Euro as a common currency, but lost its policy autonomy.
 - $\circ\,$ Ecuador's dollarisation led to losing of monetary autonomy and exchange rate policy autonomy.
- Seigniorage- It can lose the revenue generated by issuing currency.

Seigniorage is a term that refers to the profit that a government or a central bank makes by issuing money.

- **Country's identity** The country may face a loss of public support or legitimacy, especially if the decision to dollarise is perceived as imposed by external forces or interests.
- **External factors-** It can increase the country's vulnerability to foreign influence and external shocks, as it depends on the US monetary policy and dollar availability.
- **Liquidity risks-** It can impair the lender-of-last-resort's ability to provide emergency liquidity to the financial system in times of crisis.

What lies ahead?

- Dollarisation is not a silver bullet, but if used well in conjunction with domestic policy, it can offer a route to success.
- Dollarisation should be implemented in a country based on dollar reserves, fiscal policy, trade policy and external shocks to realise its full potential.

De-dollarisation

• It is the process of *reducing the reliance on the US dollar* as a reserve currency, a medium of exchange, or a unit of account in the global economy.

• It gained prominence due to US-China trade war, COVID-19 pandemic, rise of digital currencies and growing multi-polarity in world economy.

• It can increase monetary autonomy, diversify their currency reserves, or challenge the US influence on the world financial system.

Global regulatory landscape-

- **China-** It is promoting the use of its <u>**Renminbi**</u> in international trade and finance, especially with its <u>Belt and Road Initiative</u> partners.

- **<u>Russia</u>**- It promotes the use of <u>**Rouble**</u> after facing US and European Union sanctions over its involvement in <u>Ukraine</u>.

- **India**- It has released a roadmap for the <u>internationalisation of the Indian rupee</u> to create broader acceptance for increasing trade and investment ties.

- **European Union-** It is promoting the use of <u>*Euro*</u> in international currency to reduce its exposure to US sanctions and monetary policy spill overs.
