

E-commerce in India

Why in news?

\n\n

India's e-commerce sector has grown multi fold which demands a change in the uncertain policy environment surrounding the sector.

\n\n

What is the status of this sector?

\n\n

\n

- E-commerce is a type of business model, or segment of a larger business model, that enables a firm or individual to conduct business over an electronic network, typically the internet.

\n

- Electronic commerce operates in all four of the major market segments in India - business to business, business to consumer, consumer to consumer and consumer to business.

\n

- India's e-commerce sector has grown quickly despite an uncertain policy environment.

\n

- While online retail accounted for less than 1% of the retail market in 2013, it is reckoned to have crossed 3% in 2018.

\n

- In several categories of electronics such as personal computers and smartphones, e-commerce holds a far larger market share.

\n

- Even in non-traditional items such as furniture and high-end fashion labels, growth has been phenomenal.

\n

- E-commerce companies such as Amazon and Flipkart have reportedly spent over Rs 5 billion in marketing during the recent Navratri period, and they

will spend more in the run-up to Diwali.

\n

- Analysts claim online sales during Navratri have crossed \$2.6 billion, or about Rs 190 billion.

\n

- This is a huge year-on-year rise over the \$1.4 billion sales during the same nine-day period of 2017.

\n

\n\n

Where does this growth come from?

\n\n

\n

- The increased impetus has been attributed to the wider market reach in **Tier II and Tier III towns**.

\n

- Small-town India reportedly contributes 82% of Amazon India's new customers.

\n

- This is also the main reason for its creation of local language interfaces and its determination to be capable of delivering in every rural pin code.

\n

- Flipkart also claims that over 50% of its new customers come from small towns.

\n

- It is interesting to consider the positive externalities that have arisen from the e-commerce explosion.

\n

- Flipkart and Amazon have close to about 100 fulfilment centres spread across multiple states between them, which makes them the prime drivers for warehousing.

\n

- The portals offer direct employment to tens of thousands, in multiple capacities, ranging from delivery to high-end data analysts to marketing.

\n

- They also deploy artificial intelligence in their India operations.

\n

- They have adopted easily accessible, in-house fin-tech solutions, offering EMIs through PayTm, Amazon Pay and PhonePe.

\n

- In turn, it induced widespread acceptance of “cashless” commerce far more effectively than demonetisation did.

\n

- So far as the consumer is concerned, apart from easy payment options, e-commerce sites offer a wider choice of merchandise along with lower prices.
\n
- In Tier II/III locations, there may be no offline alternatives for the many categories of goods available online.
\n
- It is, therefore, no exaggeration to say that e-commerce has triggered a retail revolution in the rural and semi-rural hinterland.
\n

\n\n

What are the concerns with the proposed draft policy?

\n\n

- **Localised production** - India does not allow FDI in e-commerce companies that hold their own inventories/stocks [inventory-based model]
\n
- Under this model, firms directly sell products from their own inventories.
\n
- On the other hand, the government allows 100% FDI in the marketplace model.
\n
- Marketplace operators like Flipkart cannot hold inventory (stocks) and sell products on their platform, where they can only facilitate the online sale process for other vendors.
\n
- However, the draft policy says that FDI may be allowed in inventory-based e-commerce companies up to 49%.
\n
- But this comes with a condition that the e-tailer sells 100% Made-in-India products.
\n
- This will allow e-commerce firms to offer their own brands only as long as they are made in India.
\n
- If restrictions on holding inventory and in the production of multiple branded goods were removed, efficiencies would be enhanced, enabling a further deepening of the market.
\n
- **Sunset clause** - The draft proposes a sunset clause, wherein maximum duration of differential pricing strategies (such as deep discounts) that are implemented by e-commerce platforms to attract consumers would be introduced.

\n

- This restriction is aimed at curbing the practice of foreign-funded companies bypassing laws to use foreign money to offer huge discounts.

\n

- Discounts help e-commerce companies gain loyal subscribers.

\n

- Domestic retailers have raised the issue of foreign money funding discounts which makes it difficult for the local retailers to compete.

\n

- Thus the sunset clause might restrict the ability of e-commerce companies to offer deep discounts, which is the very base of its attraction over the brick-and-mortar retailers in India.

\n

- **Related parties** - The draft e-commerce policy also places curbs on "related parties".

\n

- Related party sellers are the online sellers who already have a business relationship with the e-commerce company.

\n

- A foreign-funded e-commerce company is not allowed to keep inventory but some companies might circumvent this rule by funding their sellers and offer discounts through them.

\n

- This results in market distortion wherein a particular seller will misuse the money power to discount the product at a faster rate while other sellers getting unable to match its sale price.

\n

- Hence the proposed curb will promote a level-playing field in the marketplace.

\n

- However, e-commerce companies would not be able to offer their in-house brands extensively with these restrictions.

\n

- **Data localisation** - The draft policy says Srikrishna committee's recommendations will have primacy on data localization and data privacy.

\n

- Both documents suggest the government will have access to data stored in India for national security and public policy objectives, subject to rules on privacy and consent.

\n

- The draft policy proposes tax sops to encourage data localization and grant infrastructure status to data centres.

\n

- However, enforcing data localisation may increase the cost of business for

start-ups and further increase their cost of capital.

\n

\n\n

What should be done?

\n\n

\n

- The draft e-commerce policy is currently in review.
- It could be a win-win situation for consumers and e-commerce players if the concerned clauses were removed or the restrictions are eased.
- Fewer policy constraints would make the sector grow faster and create more employment, better real estate occupancy and lower prices for consumers.
- The developed countries in the WTO are already demanding discussions on liberalising e-commerce trade and hence India's step towards formulating a domestic policy for this fast-growing sector is a welcome step.
