

Electronic Voting Machines

Why EVMs were introduced?

\n\n

- \n
- Illegal efforts to shape electoral outcomes are not uncommon.
\n
- Electoral fraud not only undermines public trust in democratic institutions, but also adversely affects the provision of public goods.
\n
- In India, with more than 800 million registered voters, and a complex multi-party system, **electoral fraud has been a leading cause for concern.**
\n
- In several constituencies under the paper ballot system, polling booths would be captured and ballot boxes would be stuffed.
\n
- To address fraud and simplify the electoral procedure, the Election Commission of India (ECI) introduced electronic voting machines (**EVMs**) **in the late 1990s.**
\n

\n\n

How EVMs help?

\n\n

- \n
- EVMs were introduced on an experimental basis in 1998 in a few constituencies in state assembly elections.
\n
- Post-2001, EVMs replaced paper ballots for all state elections.
\n
- An important feature of EVMs was that these could **register only five votes per minute.**
\n

- Thus, the polling booths had to be captured for a longer period to rig elections, thereby increasing the cost of electoral fraud.
- EVMs would **improve the efficiency** of tallying electoral results, thereby reducing human error.

\n\n

What is the data supporting the fact?

\n\n

- Using state assembly election results between 1976 to 2007, it is found that the introduction of EVMs led to a significant decline in electoral fraud.
- **The introduction of EVMs led to a 3.5% decline in voter turnout.**
- The decline was substantially larger in states prone to electoral fraud, where politicians faced serious criminal charges.
- These **results could also be explained** by voters' negative preference toward voting machines, or the formation of long lines in polling booths due to the upper limit on the maximum votes per minute.
- To address all of these issues, **post-poll survey data** was collected and analysed by an independent agency.
- Interestingly, they found that the ability of vulnerable citizens (illiterates, females, SC, ST) to cast their vote improved significantly after the introduction of EVMs.
- Additionally, EVMs also led to a virtual elimination of rejected or error-ridden votes.
- In a rigged electoral system, politicians fail to provide security to ordinary people because they depend on criminal elements in the electoral process.
- **A district-level data on crimes from the NCRB** suggested a very strong link between the introduction of EVMs and decline in crime.
- Also, the introduction of EVMs led to a serious decline in the vote share of incumbent parties. These effects were more pronounced in states prone to

electoral violence.
