

Flaws in the “Draft Forest Policy - 2018”

What is the issue?

\n\n

\n

- A truly effective forest policy for India must be based on facilitating community-managed forests.
- But the ‘Draft Forest Policy - 2018’, which is intended to replace the current “National Forest Policy (1988)” undermines this.

\n

\n\n

What is the current status of Forests?

\n\n

\n

- The status of our forests is reported every two years in the State of Forest Reports (SFRs).
- Since 1987, 15 such reports have been published, the latest being SFR 2017, published in February 2018.
- SFRs have multiple sets of data on growing stocks (the sum total of volume of all trees in the forest), and the forest cover within the recorded forest areas.
- All data are not available for all the years, but there is enough to enable a coherent analysis on the health of our forests.
- SFR 2017 recorded India’s total forest cover as 0.71 million sq. Km, which is 21.54% of the country’s geographical area.
- Out of this, dense forests (more than 40% canopy cover) are 0.41 million km² and open forests (10-40% canopy cover) 0.3 million km².

\n

\n\n

What are the trends in Forest since NFP-1988?

\n\n

\n

- **The Aim** - NFP 1988 was enacted to “preserving the remaining natural forests” and for “increasing substantially the forest/tree cover in the country”.

\n

- It debarred the private sector from raising plantation on forestland and encouraged them to source raw materials directly from farmers.

\n

- It promoted substitution of wood with other materials.

\n

- It also envisioned ownership rights over trees for forest dependent weaker communities for bettering conservation efforts.

\n

- **Spread** - In 1989 (immediate aftermath of the NFP-1988), the total forest cover was recorded as 0.64 million km², i.e., 19.47% of the geographical area.

\n

- While an area of 0.38 million km² had dense forest cover and 0.26 million km² was open forests in 1989, it has increased considerably from there.

\n

- Hence, India’s forest cover has increased by 68,139 km² in the last 30 years, which is equal to 1.5 times the area of Haryana.

\n

- But, most of the increase (70%) has been in the category of open forests, which are largely degraded forests.

\n

- Since 2011, State of Forest Report (SFR) has also been counting forested areas outside the “Recorded Forest Areas (RFA)”, which are government protected.

\n

- Forests outside recorded areas (on private lands), marked about 36,000 Km² increase (Contrastingly, recorded forests decreased by 19,800 Km²).

\n

\n\n

\n

- **Quality** - Growing stock is an indication of forest health, and there has been a general decline in “growing stock”, for decades now, implying

degradation.

\n

- It has reduced from 4781.4 million cubic metre (m³) in 2002 to 4218.4 million m³ in 2015—a decline of 12% in a little over a decade.
- \n
- This could be because of the diversion on more than 10,000 km² of forests for mining, irrigation, power and other infrastructure projects.
- \n
- **Conclusion** - The health of our forests has declined significantly.
- \n
- Most of the increase in dense forests is just plantations on private land and changes in dense forest cover inside RFAs are insignificant.
- \n
- The increase in total forest cover is also largely because of trees grown outside forests, mostly under social and farm forestry.
- \n
- Recorded forests have experienced significant degradation in the last 30 years, which has caused significant losses to ecological diversity of the country.

\n

\n\n

Why did NFP-1988 fail?

\n\n

\n

- Increasing tree cover outside RFAs and promoting agro-forestry is a positive step, but much needs to be done to realise the full utility of agro-forestry.
- \n
- While the policy of substituting wood with plastic and metals have been successful, but the goal of preserving natural forests has failed miserably.
- \n
- Vesting forest rights in forest-dependent communities is being resisted tooth and nail by the forest department, which is not in good vein.
- \n
- Notably, “Forest Rights Act - 2006” took the matter out of the hands of the foresters, thereby enabling some form of community ownership.
- \n
- It the NFP of 1988 didn’t fail, but its implementation did.

\n

\n\n

How does the current draft policy (NEP-2018) look?

\n\n

\n

- We need a forest policy that recognises the role of forestry in climate change and the potential of people to grow, manage, and use forests sustainably.
- Unfortunately, the draft NFP 2018 fails to do this, and has many controversial provisions like bringing private sector into forest management.
- It also seeks to reassert control of the forest department over the forests by undermining the Forest Rights Act, which would be a regressive step.
- All these give the indication that India hasn't woken up from the colonial mindset in forest management (which seeks to isolate forest dwellers).
- Significantly, many countries worldwide have become mere facilitators in forest governance by handing over control to their native forest dwellers.
- Nevertheless, some good objectives like promoting agro-forestry and reversing the wood-substitution policy are also there in the draft policy.
