## Focus on Renewable Energy

### Why in news?

\n\n

India will host the second edition of RE-Invest, its largest investor conference for renewables soon.

\n\n

### What is the objective?

\n\n

\n

- The RE-Invest series of Investors' Meet & Expo will be hosted by the Ministry of New and Renewable Energy (MNRE).

\n

- It showcases India's renewable energy potential and the Government's efforts to scale up capacity to meet the national energy requirement in a socially, economically and ecologically sustainable manner.

\n

- This edition will also host the First Assembly of International Solar Alliance (ISA) and the 2nd Meeting of Indian Ocean Rim Association (IORA) Renewable Energy Ministers.

\n

\n\n

### What is the current RE status?

\n\n

\n

- India announced a target of 175 gigawatts (GW) of renewable electricity capacity.

\n

- Renewable power installed capacity has already reached over 70 GW and over 40 GW renewable power capacity is under construction/tendered.

- Globally, India stands 4th in wind power, 5th in renewable power and 6th in solar power installed capacity.
- Trends suggest that India's target will not only be achieved but exceeded.
- Tariff based competitive bidding process has increased competition and lowered India's RE tariffs, among the lowest in the world.
- Yet, annual investment is just 3% of the global total which has averaged \$10 billion in the last four years.

## What should be the focus areas?

- **Decentralisation** - There is a need to increase demand for renewables not only at the central level but also at state, district and city levels.
- Demand could be aggregated at the household level so that bottom-up, demand-driven RE growth be strengthened.
- **Power purchase agreements** - The rapid fall in RE tariffs has created expectations that each subsequent round of bidding will bring prices down further.
- While the resultant cheap RE prices are advantageous for discoms, utilities get lower financial realisations than they previously received.
- But the larger concerns that affects power utilities like poor procurement practices, system-wide inefficiencies, and cross-subsidised electricity still persists.
- This makes the utilities reluctant to sign PPA's or failing to honour the discovered prices resulting in failed contracts.
- PPA's have to be structured in a way that it balances transparent reverse auctions and the state-imposed tariff caps, so that it benefits both power producers and the consumers.
- **Risk assessment** - Currently, there is no compensation for RE developers if the grid doesn't absorb variable renewable electricity.

- \n
- Hence, to reduce curtailment risk, a '**grid integration guarantee**' is being designed to apportion risk across not just developers but also grid planners/operators for transmission related issues.
- \n
- With proper risk assessment, it should eventually lead to insuring developers against the curtailed power.
- \n
- **Safeguard duties** - SC recently lifted a stay on proposed duties of 25 per cent on solar cells and panels imported from China and Malaysia.
- \n
- On one hand, increased costs of these equipment could increase generation costs and make previously bid tariffs unviable, while on the other the government is also capping RE tariffs.
- \n
- This creates double burden on the project developers.
- \n
- Safeguard duties could give a temporary respite to domestic manufacturers, but cannot alone build a robust manufacturing base.
- \n
- Domestic manufacturing capacity should be boosted while reducing over-dependence on cheap/subsidised imports from China.
- \n
- This needs focus on the entire manufacturing value chain, including cells, modules, wires, inverters, and balance of systems.
- \n

\n\n

## **What more could be done?**

\n\n

- \n
- India's RE focus should not be restricted to solar photovoltaic and onshore wind.
- \n
- Emerging ones like Solar thermal technologies needs to be explored which reduces the need for storage and could increase domestic manufacturing value addition.
- \n
- Financial instruments that could de-risk projects or give easier access to credit for rooftop owners/developers should be developed.
- \n
- Utilities could develop new business lines to integrate RE, distributed generation and electric vehicle charging.

\n

- Decarbonisation of the industrial sector could be done by leveraging industrial sector to invest in renewables.

\n

- RE-Invest is an opportunity to reaffirm our commitments to targets, respecting contracts, reducing losses, and encouraging innovation.

\n

- This will make India as the largest clean energy market in the world to operate on market-friendly principles.
