

## Future of Electric Cars

### Why in news?

\n\n

\n

- Britain recently decided to outlaw the sale of new diesel and petrol cars and vans from 2040 in a bid to cut air pollution.

\n

- French government also made a similar proposal to ban petrol and diesel cars, including hybrid vehicles that have an electric motor and a petrol or diesel engine.

\n

\n\n

### What are the challenges?

\n\n

\n

- In the UK, demand for diesel cars dropped 10% in the second quarter of this year.

\n

- People like the idea of reducing their carbon footprint, as well as electric cars' fast acceleration and noiselessness.

\n

- But there are several challenges.

\n

- No more than 10% of those who consider an electric vehicle actually buy one.

\n

- There are the longer-term questions of whether the charging infrastructure will keep up with the number of vehicles, and availability of electrical grids.

\n

- Financial incentives can help by bringing electric-car prices close to those of traditional vehicles but they're not enough for a breakthrough.

\n

- Only countries such as Norway, where the incentives make electric vehicles appreciably cheaper to buy and own, have seen significant uptake.  
\n
- Governments are rightly hesitant to force something on consumers that doesn't really work for them.
