## Geography

Discuss the factors that affect Indian Monsoon and explain its mechanism.

\n\n

\n\n

Answer

\n\n

### Factors affecting the Indian Monsoon and Its Mechanism

\n\n

### Physiography

\n\n

\n

#### 1. **Existence of the Himalayan and the Tibetan plateau:**

\n

\n\n

\n

- The jet streams that lie about 12 km in the troposphere are bifurcated by the Himalayan Mountains and the Tibetan Plateau

\n

\n\n

\n

#### 2. **Triangular relief structure of south Indian land mass:**

\n

\n\n

\n

- This results in two branches of south west monsoon.

\n

- The Arabian Sea branch covers more area than the Bay of Bengal branch

\n

\n\n

## Temperature

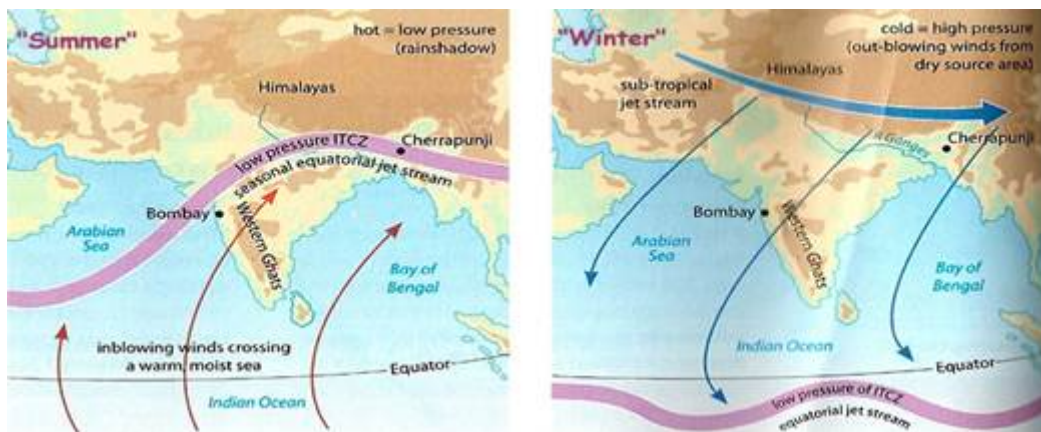

\n\n

\n

- Movement of ITCZ.

\n

\n\n

\n\n

\n

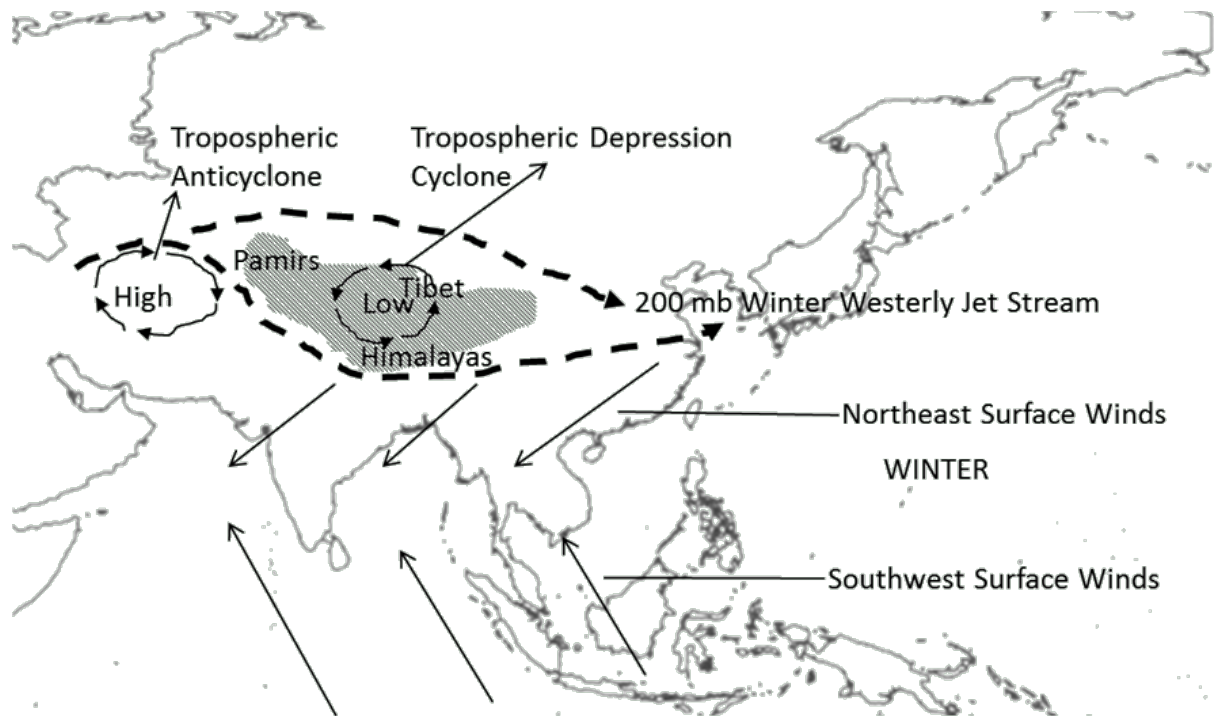

- The differential heating and cooling of the landmass of Asia and the Indian Ocean.

\n

- Strong vertical air currents from Tibetan plateau.

\n

\n\n

\n\n

## Direction of rain bearing winds

\n\n

- \n
- Movement of westerly jet streams to the north of Himalayas.
- \n
- Presence of easterly jet streams in the Indian peninsula.
- \n

\n\n

## Seasonal distribution of rainfall

\n\n

- \n
- Rainfall is mostly dependent on the monsoonal seasons
- \n

\n\n

## Amount of rainfall

\n\n

- \n
- It is not same all over India, it depends upon origin of monsoonal winds.
- \n

\n\n

## Form of precipitation

\n\n

\n

- The occurrence of heavy-light snow over the Himalayan region, due to artic cold winds.

\n

\n\n

## Global climatic phenomenon

\n\n

\n

- El Nino and La Nina.

\n

\n\n

\n\n

\n

- High pressure area in East of Madagascar-It lies in the path of SW monsoonal winds.

\n

\n
