

## Ground Water Crisis

### Why is the issue?

\n\n

A new regulatory regime for groundwater that provides for equitable use is urgently needed.

\n\n

### What is the present scenario?

\n\n

- \n
- India is facing a severe water crisis that requires immediate attention.  
\n
- The primary source of domestic water and irrigation is groundwater but the media and policymakers often focus on surface water.  
\n
- Water tables have been falling rapidly in many parts of the country, indicating that, use generally exceeds replenishment.  
\n
- Indeed, the quality of the water pumped is also increasingly becoming cause for concern  
\n

\n\n

### How has groundwater use evolved in India?

\n\n

- \n
- In the mid-19th century the British administration decided that the easiest way to regulate groundwater was to give landowners a set of rules on what amounts to proper use.  
\n
- Over the following decades, landowners started seeing groundwater as

their own, a resource they can exploit without considering the need to protect and replenish.

\n

- Access to a source of groundwater has progressively become a source of power and economic gain.

\n

- The latter has become increasingly visible in recent decades with the increase of mechanical pumps, which allows big landowners to sell water to others.

\n

- This has become a menace as the immediate consequences of over-exploitation is not felt.

\n

\n\n

### **What are the steps taken by the union government in this regard?**

\n\n

\n

- The Union government recognised the need to modernise the regulatory framework for accessing groundwater soon after massive expansion in mechanical pumping.

\n

- In the early 1970s a model Bill was first introduced, which focussed on adding some State-level control over groundwater use, but did not take away the unlimited access that the landowners enjoyed.

\n

- This was only taken up by around a dozen States from the late 1990s onwards, whereas the others are yet to address this issue.

\n

- In addition, there is no provision in the existing legal regime to protect and conserve groundwater at the aquifer level.

\n

- Further, the present framework remains mostly top-down and fails to give gram sabhas and panchayats a prevailing say in the regulation of what is essentially a local resource.

\n

- The failure of the present legal regime has been officially recognised since at least the beginning of this decade, by the erstwhile planning commission & the Ministry of water resources.

\n

- As a result, the Groundwater (Sustainable Management) Bill, 2017 was

introduced.

\n

\n\n

## **What are the highlights of the 'Groundwater Bill, 2017'?**

\n\n

\n

- The bill proposes a new regulatory framework based on the recognition of the unitary nature of groundwater pool, the need for decentralised control and the necessity to protect water at the aquifer level.
- It recognition water as a public trust and a fundamental right.
- The Bill also builds on the decentralisation mandate and seeks to give regulatory control over groundwater resources to local bodies.
- The proposed new regime will benefit the resource, through the introduction of groundwater security plans and valuable local participation.
- This will serve as a mandate to use groundwater wisely, protect it for our own benefit, as well as for future generations.
