

## Human Judgement in Data World

### What is the issue?

\n\n

It is essential to complement the increasing emphasis on "data" with the human judgement, for better decision-making.

\n\n

### How is data gaining significance?

\n\n

- \n
  - Most of the processes of day-to-day usage are also getting digitised.
  - \n
    - There is increasing emergence of different social network platforms, blogs, etc.
    - \n
      - Deployment of sensors and adoption of hand-held and wearable digital devices are also increasing.
      - \n
        - Meanwhile, there is explosion in the usage of internet.
        - \n
          - Anything and everything “smart” means greater data volumes at accelerating speeds.
          - \n
            - All these result in huge amount of data being generated on a continuous basis.
            - \n
              - It is estimated that world’s population collectively generates 2.5 quintillion bytes of data every day.
              - \n
                - The world is thus getting increasingly ‘datafied’ in every single moment.

\n\n

## What is the emerging view?

\n\n

\n

- Insights from vast arrays of data will be a key business differentiator in the near future.

\n

- This is expected to promote popularity of business analytics, and demand for data scientists.

\n

- Deriving insight from data to understand their origin and making sense of the numbers are emphasized.

\n

- This understanding on data will then be used to make informed decisions.

\n

- Increased availability of data, the "big data", can work as raw material for business intelligence.

\n

\n\n

## What are the concerns?

\n\n

\n

- **Understanding** - However, more data does not necessarily mean better performance.

\n

- It is essential that the employees are able to incorporate the data into complex decision-making.

\n

- Without ensuring this, investments in analytics can be useless and even harmful.

\n

\n\n

\n

- **Ambiguity** - So much data come from so many sources leading to ambiguity, inconsistency and contradictions.

\n

- So the basic principles that make for good strategy or decision often get obscured.

\n

- Mechanically developing strategies “free of human judgment” would thus be a mistake.

- \n
- As, decision making and strategy building involves a larger cognitive and sometimes social processes.

\n

\n\n

## What is the way forward?

\n\n

- \n
- Numbers cannot deal with every nuance of a decision.
- \n
- Generating insight is an inherently human trait and strategy is a way of thinking.
- \n
- However, it is not that data are not useful, as it all depends on how the data are used.
- \n
- So processes and human capabilities should keep pace with the computing fire-power and information they import.
- \n
- To overcome the insight deficit, Big Data needs to be complemented by big judgment.

\n
