

## **Inclusive Healthcare**

## What is the issue?

 $n\n$ 

With increasing emphasis on technology in healthcare, it is essential to ensure that it does not leave out the most in real want of it.

 $n\n$ 

## What is the need?

 $n\n$ 

۱n

• The need for a healthy relationship between technology and medicine is vital in today's world.

\n

• This relationship is determined by the interaction between tech companies and the medical profession.

\n

- The entry of technology is believed to close the gap of relative lack of medical professionals to cover India's large population.
- $\bullet$  The logic is that e-health and phone advice could address this lacuna.
- $\bullet$  But on deeper reflection, this view seems to be flawed, given the nature of functioning of the healthcare system in India. \n

 $n\n$ 

## What are the concerns in India?

 $n\n$ 

۱n

• The number of medical professionals for the able-to-pay populace (as against the total population) is far too many (more than in developed nations).

- So the majority of Indians, who cannot pay, are unable to access the level of medical care available to the favoured few.
- Tech companies, being corporate bodies and profit-seeking, are driven to focus on the patients who can pay.
- $\bullet$  Notably, this section is the same favoured few served by medical professionals.  $\ensuremath{\backslash n}$
- The fact that they want to serve the unattended many is hence suppressed.
- There is lack of effort to elevate the earning capacity, improve the health standards of the people and improve the quality of public hospitals.
- $\bullet$  So the aim of technology should be to help the underserved receive the same quality of care available to the fortunate few.  $\mbox{\sc h}$
- It should complement and improve the ability of professionals to do their assigned tasks.
