

## Maharashtra's Plastic Ban Plan

### Why in news?

\n\n

Maharashtra government's has decided to ban the manufacture, use, sale, distribution and storage of plastic materials.

\n\n

### What is the decision of Maharashtra on plastics?

\n\n

- \n
- As a large, highly industrialised state, Maharashtra is the 25th Indian state to impose a ban on plastics.  
\n
- Maharashtra is responsible for generating the largest quantity of plastic waste 460,000 tonnes per annum.  
\n
- To address this issue the state has implemented ban on manufacture, use, sale, distribution and storage of plastic materials.  
\n
- The government offered a three-month "grace period" to eliminate existing stocks and find alternatives.  
\n
- It now intends to impose drastic penalties, including large fines and potential jail terms for violations.  
\n
- However, there is much confusion amongst the general populace and user-industries, as to which categories are permissible and which are banned.  
\n

\n\n

### What are the issues with managing toxic wastes in India?

\n\n

- \n
- Though India has a low per capita consumption, it is still a major contributor to global toxicity due to poor waste management practices and the sheer size of the population.

\n

\n\n

- \n
- Apart from choking India's landmass, contaminating drinking water, killing animals, plastics flowing down India's rivers are estimated to contribute as much as 60 per cent of global ocean contamination.
- \n
- Industry will see up to 300,000 job losses and adverse impacts along the whole value chain due to policy measures to manage toxic wastes.
- \n
- The compliance record of plastic ban in most Indian states is very poor and the bans exist only in name.

\n

\n\n

### **What measures needs to be taken?**

\n\n

- \n
- Eco-friendly alternatives such as jute and recyclable categories of plastics replace toxic "thin" plastics, new employment opportunities will surely be created.
- \n
- Carry bag production using cloth can create more jobs than machines using plastic pellets.
- \n
- Any policy that aims to reduce plastic use must be well designed to induce behavioural changes at several levels from usage to disposal.
- \n
- Countries in the European Union use taxation policies, imposing heavy taxes on certain categories of plastic while offering incentives to make and use eco-friendly substitutes Indian can also try such models.
- \n
- After all educating consumers about the need for the proper disposal of all sorts of wastes, including plastics, is the only way for a ban be sustainably executed.
