

Mitochondrial Donation Treatment

Why in news?

An announcement was made recently that a baby was born using three persons' DNA in the UK.

What is mitochondria?

- **Mitochondria** - They are membrane-bound cell organelles that are the powerhouses of the cells as they generate the energy needed to power the cell's biochemical reactions.
- Chemical energy produced by the mitochondria is stored in a small molecule called adenosine triphosphate (ATP).
- Mitochondria contain their own small chromosomes.
- Generally, mitochondria, and mitochondrial DNA, are inherited only from the mother.
- **Mitochondrial diseases** - When the mitochondria are impaired and do not produce sufficient energy, it affects the functioning of organs.
- The diseases that arise out of mitochondrial mutations are called mitochondrial diseases.
- Mitochondrial diseases are only passed on by the mother.
- It has no cure, but can be treated.
- In order to prevent the child from inheriting the mother's mitochondrial disease, the three parent technology was used.

What is Mitochondrial Donation Treatment?

- Mitochondrial donation treatment is also known as **mitochondrial replacement therapy (MRT)**.
- **Advanced in-vitro fertilization technique** is used for mitochondrial donation treatment.
- The baby's biological father's sperm was used to fertilise the eggs from the biological mother, who has a mitochondrial disease, and a third, female donor with clear mitochondria, separately.
- Then, the nuclear genetic material from the donor's egg is removed and replaced with the genetic material from the biological parents'.
- The final product (the egg) which has the genetic material from the parents, and the mitochondria from the female donor, is implanted in the uterus.
- This baby (three-parent baby) will be **free from the mother's mitochondrial disease**.

Three-parent babies

The technique involves using DNA from three people in order to prevent serious inherited diseases

In-vitro fertilisation (IVF) with mitochondrial DNA

What are the short falls of mitochondrial donation treatment?

- Sometimes it is possible that a small amount of the maternal mitochondria with errors may get passed on during the procedure.
- So-called reversion or reversal could lead to a disease in the child.

The UK is not the first country to create babies from MDT. In 2016, a US doctor announced the world's first MDT birth after treating a woman who carried mitochondrial mutations that cause Leigh syndrome.
