

## Online Giant Monopolies

### What is the issue?

\n\n

Data aggregating online ad firms like Google and Facebook have almost completely monopolised their niche areas.

\n\n

### What are bail-bond companies?

\n\n

\n

- Bail-bond companies are organisation that provides pledge money or property as bail (as surety) for the appearance of persons accused in court.

\n

- In the U.S., such companies largely profit from “communities of colour and low income neighbourhoods when they are most vulnerable”

\n

- Also, as bail-bond firms use “opaque financing offers that can keep people in debt for months or years”, Google finds the industry immoral.

\n

- Hence, recently, Google banned bail-bond companies from advertising on its platforms, claiming that the industry’s work offends its values.

\n

\n\n

### What is the impact of Google’s ban on advertising?

\n\n

\n

- Media companies have for long decided what content or ads to carry based on its cherished values, but Google’s case is unique.

\n

- Notably, no ad company has ever come close to controlling over 90% of the market space in a particular domain, like Google does in internet search.  
\n
- Significantly, Facebook, which undisputedly has the largest share in the social media space, has also banned bail-bond companies, following Google's lead.  
\n
- Considering the near monopolistic position of these large firms in their niches, these bans effectively close all modes of online advertising for bail-bond firms.  
\n
- Bail bond companies could still show up in search results, and reach out to clients through their own websites, but outreach has become much harder.  
\n

\n\n

## What are the larger implications?

\n\n

- Whether data controlling firms like "Google and Facebook" are too big, leading to suppression of market competition, is often speculated in recent times.  
\n
- "Data monopoly firms" affect not only our wallets but also our privacy, and autonomy, making them more dangerous than conventional monopolies.  
\n
- In this context, bail-bond ad ban raises a different, and potentially more troubling, possibility - they also get to dictate values and ideas.  
\n
- **Increasing Objectivity** - From another angle, data majors are facing increasing external pressure to weed out fake news and inciting content.  
\n
- This has forced them to get increasingly objective (taking stands) about their outlook towards content on their sites.  
\n
- Hence, the issue is complex and data firms can't be solely vilified.  
\n

\n\n

## What is the way ahead?

\n\n

\n

- **Free Markets** - Had there been sufficient competition among players in the data space, bans by one or two companies wouldn't have mattered.

\n

- But the pro-active “mergers and acquisition” drive carried out by Google and Facebook has effectively ensured that their monopolies remain.

\n

- If markets lack competition, then the need for governmental pressure to regulate the market is needed, but that is again a complex mesh to explore.

\n

- **Preventing Monopolies** - It is ideal to prevent emergence of monopolies in the 1<sup>st</sup> place through hard hitting “out of the box” policies.

\n

- Breaking up big firms through legislations is fraught with legal hurdles and the resultant consequences are also highly unpredictable.

\n

- But when firms proceed towards their next acquisition, government needs to get innovative to ensure that market competition isn't compromised.
