

Potential US-China Trade War

What is the issue?

\n\n

\n

- The US and China are announcing tariff hikes on a range of each other's import products.

\n

- The retaliatory measures are potential of taking shape as US-China trade war.

\n

\n\n

What is the US decision?

\n\n

\n

- The US announced a proposed list of products imported from China that could be subject to additional tariffs.

\n

- It announced a possible 25% tariff amounting to \$50 billion on around 1300 Chinese imports.

\n

- The sectors include industries such as aerospace, information and communication technology, robotics, and machinery.

\n

- After completion of the review process, the final determination on the products subject to the additional duties will be issued.

\n

\n\n

What is the rationale?

\n\n

\n

- China has its “Made in China 2025” industrial promotion policy in place.
\n
- The unfair intellectual property and technology transfer practices under it are said to cause harm to the US economy.
\n
- They allegedly coerce US companies into transferring technology and intellectual property to domestic Chinese enterprises.
\n
- The proposed list of products is thus based on an extensive inter-agency economic analysis of the harm.
\n
- The measure thus targets products that benefit from China’s industrial plans while minimizing the impact on the US economy.
\n
- Also, the issue of US's trade gap with China is highlighted as a reason.
\n
- U.S. is not ready to afford to have a \$500 billion a year trade deficit with Beijing.
\n

\n\n

What will the implication be?

\n\n

- The US administration is right to take measures against China’s abuse of economic and trade policy.
\n
- But imposing tariffs on producer goods will inadvertently hurt Americans.
\n
- The tariffs could hurt companies by raising prices.
\n
- It could result in reduced capital investment and lower productivity growth.
\n
- It could also reduce consumption of the capital equipment they rely on to produce their goods and services.
\n
- Hitting Chinese manufactures in high-technology sectors could also hurt U.S. businesses that have plants in China.
\n
- Notably, China has low labour and manufacturing costs.
\n

\n\n

What is desired?

\n\n

\n

- Attempts to roll back Chinese innovation mercantilism should be more carefully targeted than this.

\n

- The focus should be on things that will create the most leverage over China.

\n

- But it should be without raising prices and dampening investment in the kinds of machinery, equipment, and other technology.

\n

- This is because machinery and technology are the ones that drive innovation and productivity across the economy.

\n

\n\n

What is China's response?

\n\n

\n

- Beijing earlier imposed tariffs on 128 US imports worth \$3 billion.

\n

- This came as retaliation against US's taxes on imported steel and aluminium. (Click [here](#) to know more)

\n

- Recently, China announced plans to levy an additional 25% tariff on imports of 106 US products.

\n

- This is a clear response to U.S.'s recent announcement of 25% tariff on some Chinese imports.

\n

- China's retaliatory tariffs include on products such as soybean, whisky, orange juice, chemicals, aircraft, cars, etc.

\n

- This would hit the U.S. as 60% of U.S. soybean exports go to China.

\n

- The tariffs imposed by China are expected to hit \$50 billion of trade in all, similar in value to Chinese goods targeted by the US.
