## Prelim Bits 23-07-2017

### Phobos

\n\n

\n

- Phobos is one of the smallest moons in the solar system orbiting around the Mars.
- It is the only natural satellite in the solar system that circles its planet in a time shorter than the parent planet's day.
- Red planet Mars has another natural satellite Deimos.
- Phobos is the innermost and larger of the two.
- Recently, NASA's Hubble Space Telescope has beamed back images of the moon Phobos in its orbital trek around the red planet.

\n

\n\n

### Urbanization and sacred groves

\n\n

\n

- Sacred groves are fragments of forests protected by local communities.
- They are also known as "Devaru kadu" in Kannada and "Kavu" in Malayalam.
- Sacred groves are usually dedicated to local folk deities and protected by communities because of their religious beliefs.
- It helps in biodiversity conservation, recharge of aquifers and soil conservation.

\n

- Hunting and logging are not permitted in the sacred groves. As a result, many sacred groves still exist in urban areas.
- With increasing urbanization, urban sacred groves are becoming home to a large number of invasive ants. It is a clear indicator of human disturbances in the habitat.

\n\n

## **Fluorosis**

\n\n

- Fluorosis is a slow, progressive, crippling disease which affects every organ, tissue and cell in the body.
- According to WHO, the fluoride concentration in drinking water should not exceed 1.5mg/l.
- Thus fluorosis is caused by excessive exposure to fluoride, beyond a concentration of 1.5 mg/l.
- It adversely affects the foetal cerebral function and neurotransmitters. Reduced intelligence in children is associated with exposure to high fluoride levels.
- Dental fluorosis is a defect in the tooth enamel caused by excessive fluoride consumption, is not treatable and the stains are permanent.
- Skeletal fluorosis is developed by the disturbance of calcium metabolism in the formation of bones in the body. It results in the softening and weakening of bones, resulting in deformities.
- The main source of fluoride in groundwater is the rocks such as charnockite, quartzite, pegmatite, laterite etc.

\n\n

## **Northern River Terrapin**

\n\n

- A terrapin is one of several small species of turtle living in fresh or

brackish water.

\n

- The northern river terrapin (Batagur baska) is a species of riverine turtle native to Southeast Asia.

\n

- It is classified “Critically Endangered” by the IUCN.

\n

- The species is currently found in Bangladesh (in the Sundarbans), India (parts- West Bengal & Odisha), Indonesia, Cambodia and Malaysia.

\n

- The northern river terrapin is omnivorous and prefers freshwater habitats.

\n

- It moves to brackish river mouths or estuaries in the breeding season (December–March), returning after laying their eggs.

\n

- A captive conservation breeding programme has been implemented in Sunderbans Tiger Reserve to protect the species against natural risks and also facilitate genetic management.
