

Refining the Oil Refining Sector

What is the issue?

\n\n

\n

- World Energy Outlook Special Report on India highlights the rising oil demand in India.

\n

- Given this and the stringent emission norms in place, it is essential to ensure a modern oil refining sector to be adaptive and competitive.

\n

\n\n

What is the need?

\n\n

\n

- **Demand** - According to International Energy Agency, India is moving to the centre stage of global energy markets.

\n

- India is notably the world's third largest consumer of energy.

\n

- With rising incomes and higher car ownership, the number of passenger cars in India is expected to multiply in the coming years.

\n

- The expected sharp rise in demand for mobility could more than double the demand for refined products by 2040.

\n

- **Trade** - However, India's oil refining capacity is falling short of meeting the rising demand for oil products, resulting in huge exports.

\n

\n\n

\n

- India could become a net importer of oil products in the not-too-distant

future.

\n

- **Emissions** - Higher dependence on oil products for mobility needs logically mean increased transport emissions.

\n

- This is a pressing issue for India where around 5 lack people die prematurely every year due to poor air quality.

\n

- **Besides**, India's Hydrocarbon Exploration Licensing Policy (HELP) alone will not be feasible to address its demands. Click [here](#) to know more about HELP.

\n

\n\n

What are the government's measures in fuel efficiency?

\n\n

\n

- India has already introduced fuel-efficiency standards not only for cars but also for trucks.

\n

- One of the most significant developments is the nationwide adoption of the Bharat Stage IV (BS IV) emission standards.

\n

- This is the regulation for transportation fuels in India (equivalent to the Euro IV standards) effective from April 2017.

\n

- It requires the sulphur content in gasoline and diesel to be no more than 50 parts per million (ppm).

\n

- The Government plans to move to an even more stringent standard by 2020 by limiting sulphur content in transportation fuels to less than 10 ppm.

\n

- To address the issue of increasing fossil fuel usage Indian government also plans to move to alternative fuels.

\n

\n\n

What is the concern?

\n\n

\n

- Surging demand in domestic and export markets offers an attractive growth opportunity for Indian refineries.

\n

- On the other hand, tightening of emission standards for transport fuels is becoming a challenge for capitalising on this opportunity.
\n
- As, the successful implementation of better quality standards depends on the capability of domestic refineries to adapt to these.
\n
- If domestic refineries cannot produce compliant fuels, moving to a tighter standard would result in more imports.
\n

\n\n

What should be done?

\n\n

- Tightening emission standards for transport fuels is fast becoming an irreversible global trend.
\n
- In this rapidly desulphurising world, those able to produce a better quality fuel stand to benefit by gaining market share in an increasingly competitive refining market.
\n
- In this backdrop, India should ensure a modern refining sector with all the technical capabilities to produce high-quality fuels.
\n
- The Government has to devise mechanisms to provide the required infrastructure for the refining sectors.
\n
- The growth of India's refining industry and the country's sustainable future are therefore closely interlinked.
\n

\n\n

Quick fact

\n\n

IEA

\n\n

- The International Energy Agency is an autonomous inter-governmental body based in Paris.
\n

- It was founded in 1974 to help countries collectively respond to oil supply disruptions.
- IEA helps governments around the world provide energy access for all, reduce air pollution, and tackle the climate change crisis.
- It publishes the World Energy Outlook report.
- India is an associate member of IEA.
