

Revival Trend in Indian Industrial Activity

Why in news?

\n\n

In India Industrial activity has been improved in terms of IIP and PMI.

\n\n

What is the status of Indian Industrial growth?

\n\n

\n

- Industrial growth is measured by the government's Index of Industrial Production (IIP) and the private sector Purchasing Managers' Index (PMI).

\n

- Both of these Indexes has been improved significantly in the months of Nov 2017 - Feb 2018.

\n

- Growth in the IIP soared to 8.8% in November, the highest since October 2015, and stood at a slightly slower but still robust 7.07% in December, this growth was largely driven by the manufacturing sector.

\n

- The PMI surged to a 60-month high of 54.7 in December 2017 and came in at 52.4 in January 2018.

\n

\n\n

How industrial activity has been revived?

\n\n

\n

- The November 2016 demonetisation had a major impact on industrial activity and the manufacturing sector was slowed down.

\n

- Activity resumed thereafter, but was hit again by the prospect of the Goods

and Services Tax and then its fallout.

\n

- Industrial activity contracted in June because firms halted production to get rid of their stock in preparation for the GST.

\n

- A combination of impending festive season and the re-stocking of inventory led companies to increase their activity thereafter, with a recovering global economy boosting exports, which further propelled industrial growth in November and December.

\n

- There were other factors at play, such as companies getting increasingly comfortable with the GST regime.

\n

- The government has also taken steps to ease the woes of exporters due to the input tax credit system.

\n

\n\n

What are implications of this revival?

\n\n

\n

- While the IIP is an output measure, the PMI is an indication of the activity at the input, or purchasing, level.

\n

- If both show strong growth, the implication is an overall recovery in industrial activity and sentiments.

\n

- Economic growth itself is expected to increase, with private sector analysts and economists saying there are signs of a recovery.

\n

- It is also important to note that the IIP and the PMI measure only the formal sector.

\n

- Several accounts say the informal sector, a very large segment of the economy that accounts for significant employment, is still recovering from the effects of demonetisation.

\n

- This trend also implies that part of the recovery is based on global economic trends, any dip there will have a detrimental effect on India's exports.

Quick Fact

\n\n

IIP

\n\n

\n

- The Index of Industrial Production (IIP) is an abstract number or ratio which measures the growth of various sectors in the economy.
- In India, IIP is a representative figure which measures the general level of Industrial activity in the country.
- Being an abstract number, it does not show volume of activity and only shows the magnitude which represents the status of production in the industrial sector for a given period of time as compared to a reference period of time.

\n

\n\n

PMI

\n\n

\n

- The Purchasing Managers' Index (PMI) is an indicator of the economic health of the manufacturing sector.
- The PMI is based on five major indicators such as new orders, inventory levels, production, supplier deliveries and the employment environment.
- The purpose of the PMI is to provide information about current business conditions to company decision makers, analysts and purchasing managers.
