

## Snow leopard conservation

### Why in news?

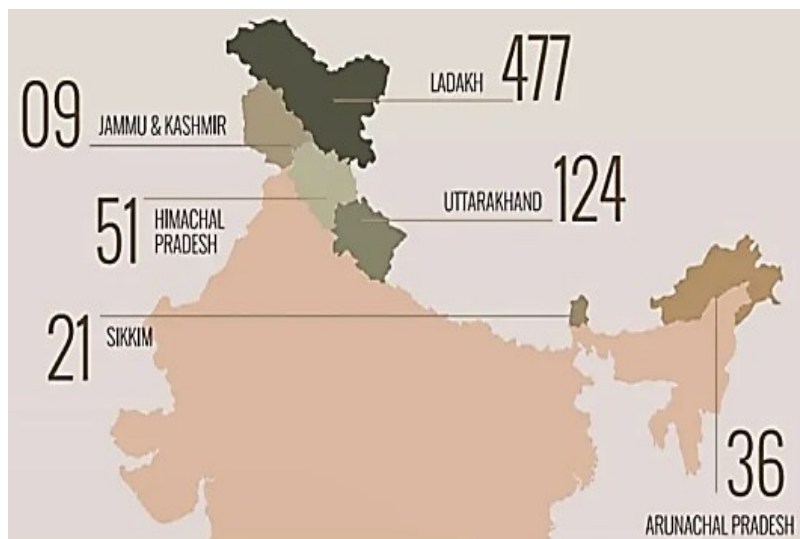

\n\n

The conservation status of snow leopard has been changed from “endangered” to “vulnerable” by the International Union for Conservation of Nature (IUCN).

\n\n

### What are the characteristic features of Snow leopards?

\n\n

\n\n

\n

- These are rarely sighted cats that live in the peaks of central Asia including the Himalayas and Russia’s remote Altai mountains.

\n

- Their habitat covers more than 1.8 million sq km, across 12 countries and usually found at elevations of 3,000-4,500m.

\n

- Their coats change with the seasons from a thick, white fur to keep them warm and camouflaged in winter, to a fine yellow-grey coat in summer.

- \n
- They are threatened by poaching for their fur, infrastructure developments and climate change.
- \n
- In India this animal habitat is in Jammu and Kashmir, Himachal Pradesh, Uttarakhand, Sikkim and Arunachal Pradesh.
- \n

\n\n

### What are the criteria for endangered status?

\n\n

- \n
- An observed, estimated, inferred or suspected population size reduction of  $\geq 50\%$  over the last 10 years or three generations
- \n
- Area of occupancy estimated to be less than  $500 \text{ km}^2$ ,
- \n
- Population size estimated to number fewer than **2500 mature individuals** witness a continuous decline
- \n
- Population size estimated to number fewer than 250 mature individuals.
- \n
- Quantitative analysis showing the probability of extinction in the wild is at least 20% within 20 years or five generations
- \n
- The current move is based on the criterion that it crossed the threshold number of 2500
- \n

\n\n

### What will be the impact of the downgrade?

\n\n

- \n
- The factors that pose a threat to the species, like trafficking live animals in Central Asia, and hostility from communities because of its attacks on livestock, remain unchanged.
- \n
- New research indicates that even when wild prey is available, the attacks on livestock by snow leopards have been on the rise.
- \n
- The bigger challenge of loss of habitat owing to changing climate patterns needs continuous conservation efforts.

- \n
- There is no clear knowledge about its population health, in remote habitat in the alpine zones of the Himalayas and trans-Himalayas.
- \n
- There are possibilities of trafficking of this animal in Central Asia, and hostility from communities because of its attacks on livestock.
- \n
- A more fundamental worry is over the likely loss of habitat owing to changing climate patterns.
- \n
- So the downgrading might send a wrong message and the governments might shift their focus away from the conservation efforts.
- \n
- It is vital that the momentum of conservation should not be lost merely on account of the technicality.
- \n

\n\n

### **What should be done?**

\n\n

- \n
- The existing conservation must be strengthened by enlarging protected areas in all the range countries.
- \n
- Studies on the leopard's vulnerability have to be intensified.
- \n
- The task of monitoring its entire habitat of high mountains must speeded up.
- \n
- The reasons for hunting livestock must be dound out to insulate the owners from losses.
- \n
- They should be encouraged to move away from traditional pastoral grazing.
- \n
- Incompatible activities such as mining and human interference in their habitats should be kept out.
- \n
