

Towards climate-resilient agriculture

What is the issue?

\n\n

Efforts to make agriculture climate-resilient must be scaled up and consolidated in order to avoid the impacts of a warming world.

\n\n

What does the IPCC report say?

\n\n

\n

- The Special Report on Global Warming of 1.5°C was recently approved by the Intergovernmental Panel on Climate Change (IPCC).

\n

- The report focusses on keeping warming to under 1.5°C as compared to pre-industrial times.

\n

- The world has already warmed 1°C since pre-industrial times.

\n

- Hence, limiting warming to 0.5°C from now means the world can keep the ecosystems much as it is now.

\n

- Adding another 0.5°C on top of that essentially means a different and more challenging Earth for people and species.

\n

\n\n

Why is India vulnerable?

\n\n

\n

- India's agricultural ecosystem is distinguished by high monsoon dependence and with 85% small and marginal landholdings, it is highly sensitive to

weather abnormalities.

\n

- There has been less than normal rainfall during the last four years, with 2014 and 2015 declared as drought years.

\n

- Even the recent monsoon season (June-September) ended with a rainfall deficit of 9%, which was just short of drought conditions.

\n

- There are also reports of an escalation in heat waves, which in turn affecting crops, aquatic systems and livestock.

\n

- The Economic Survey 2017-18 has estimated farm income losses between 15% and 18% on average, which could rise to 20%-25% for unirrigated areas without any policy interventions.

\n

- These projections underline the need for strategic change in dealing with climate change in agriculture.

\n

\n\n

What are the steps needed?

\n\n

\n

- **Interventions** - Apart from traditional wisdom, farm extension services and climate resilient technologies should guide farmers' responses to climate change.

\n

- The climate resilient techniques could include solar pumps, drip irrigation and sprinklers, which involves minimum consumption of electricity and water.

\n

- Climate exposure can also be reduced through proper agronomic management practices such as inter cropping, multiple cropping and crop-rotation at the field level.

\n

\n\n

\n

- **Awareness** - The NSS 70th round indicates that a very small segment of agricultural households utilised crop insurance due to a lack of sufficient awareness and knowledge.

\n

- Hence there is an urgent need to educate farmers by reorienting Krishi

Vigyan Kendras with specific and more funds about climate change and risk-coping measures.

\n

- **Framework** - Climate adaptations are to be mainstreamed in the current developmental framework which is still at a nascent stage. (Economic Survey 2017-18).

\n

- Mainstreaming adaptation into the policy apparatus will enable identification of several barriers that prevent up-scaling efforts and adaptation by farmers.

\n

- Other initiatives towards building greater resilience in agriculture should include -

\n

\n\n

\n

1. Expansion of extension facilities

\n

2. Improving irrigation efficiency

\n

3. Promotion of satellite-enabled agriculture risk management

\n

4. Creating micro-level agro-advisories

\n

5. Providing customised real time data

\n

6. Capacity building of stakeholders

\n

\n\n

What is the importance of SAPCC in this regard?

\n\n

\n

- The State Action Plans on Climate Change is an important platform for adaptation planning.

\n

- Under it, states are encouraged by the centre to come up with innovative and scalable projects to develop resilience against climate change and mainstream it in the planning processes.

\n

- Some of the components under these schemes are getting converged with major rural developmental programmes of the centre, which will further enhance their effectiveness at the grass-root level.

\n

- However, it needs to evolve further in terms of climate-oriented regional analysis to capture micro-level sensitivity and constraints.

\n

- Thus, greater expertise and consultations are required here for systematic prioritisation of actions to build a climate resilient agriculture.
