Average Body Temperature

- The thermometer reading of 98.6°F was laid down as the “normal” human body temperature, for about half a century.
- Over the last few decades, the benchmark has often been questioned.
- Different studies have found the human body temperature averaging out differently, including at 97.7°, 97.9° and 98.2°F.
- Now, new research has found that body temperatures have, in fact, been declining over the last two centuries.
- that body temperatures have, in fact, been declining over the last two centuries.
- This was determined from an analysis of records of Americans dating between the 19th century and 2017.
- The new study, published in the journal eLife that concluded the average human body temperature has never been constant in the first place.
- The calculations from a research correspond to a decrease in body temperature of 0.05°F every decade.
- The researchers have proposed that the decrease in body temperature is the result of changes in the environment over the past 200 years, which have in turn driven physiological changes.
- The decrease in average body temperature could be explained by a reduction in metabolic rate, or the amount of energy being used.
- The strong influences of age, time of day, and genders on body temperature preclude definition of Average body temperature.
