

Despite challenges - One Sun, one world, One grid
represents the vision. that should be guiding co-ordinated.

Global Action on climate change. Discuss.

The Tropics: When coming to climate change, it
was always the tropical countries as majority who

has been looked down as a victim and also who
has been blamed for climate change pattern.

Their Situation: Most tropical countries especially

developing countries like India, Sri Lanka, South-east
Asian countries, South Africa & American countries.

faced an era of colonialism where they were even
deprived of basic resource light and depletion of resource
by the developed nation.

The COP-26 Agenda: This actually paved them to opt.

for a low-cost efficient resource production for.

Power generation and electricity, since most of these countries

hold the responsibility to serve the poorest of the poor.

But in the COP-26 Agenda it was quietly played by developed.

Countries in different level. Despite of the fact. about. NDC and SDG has been successful to some. extend Plans like One sun, one world, one grid has. always touched the scope. of the tropical countries. for betterment.

Reasons: Tropical countries. with these. projects like. One sun, one world, one grid would produce solar. energy and as well as renewable power source with. Sustainability to the greater extend. For formation of groups like. Small Island consortium groups had given a. thumbs up towards these projects.

Issues: But these projects are. easily said then done. because these project require a huge investment. costs, which now turns the question on carbon. emission trading, green climate fund, which has been. Successfully planned only till. Paris conference don't. by the developed nations. More than the tropics the. responsibilities of developed nations lies more in. transfer of technology, fund, resources for a. better of these projects. Therefore a co-ordinated. Action. by the entire globe. is required for OSOWOG.
