## Environment

India needs to adopt a rigorous dashboard based approach towards environmental indicators in the country. Do you agree with this view? Comment (20, words)

India's ranking in the recently <sup>conducted</sup> Survey of Environmental Index was very poor according to the data.

India have performed low in Air quality, increase in forest cover, Protection of Sanctuaries etc,

Though the survey didn't taken into Account the principle of CBD-RI, it provided somewhat reliable report according to some scholars.

### Dashboard:

Dashboard which records the country's performance in terms of numerics, and on a real time basis.

### Dashboard for the Indexes:

We need Dashboard for selective areas

in which we are under performing these many decades.

Air Quality Index: Already we are polluting ahead of the WHO's Prescribed limits.

Ex: Delhi <sup>Air</sup> Pollution is high and death rate because of Air Pollution have been reported approx. 8 Lakh.

Environment & Wildlife Protection: Coastal Protection Zones and Corals have been neglected long time back and <sup>now</sup> we need Rigorous Protection for them.

Forest Cover: Recently India have reformed the forest cover definition and showed increased in forest cover but according to satellite images, the dense forest have been abysmally low.

The Dashboard for each and every index will cost much, so <sup>pick's</sup> the selective areas and integrate the report will give a clear picture of the state's environmental protection and it will provide a global leadership for India among Global Countries.
