

The induction of EV by GOI Intends to reduce pollution from the road transport sector in near future. Analyse in the light of FAME India Scheme.

Fastest Adoption & Manufacturing of hybrid and Electric vehicles [FAME] India scheme encourages the growth of eco-friendly vehicles on road.

FAME India scheme has given the government an opportunity to improve public transport system, such as Delhi government's move to include ~~new~~ new e-buses, new e-rickshaws, e-cabs. The latent function of the scheme is that the citizens can visibly see the use of tax revenues ^{to reduce air pollution} as a result psychologically strength tax compliance behaviour.

FAME India scheme will act as a means to replicate the growing success of e-rickshaws, e-bikes providing end-to-end connectivity in cities like Delhi, Bengaluru. It will also strengthen Make in India program in a greener ~~and~~ / sustainable way.

FAME India scheme is a means to achieve our intended nationally determined contributions [INDC] to United Nations Framework on Climate Change [UNFCCC] by helping in reducing emissions intensity to GDP & promoting cleaner economic development.

However enough care is to be taken by the government in tandem with power generation companies to generate electricity through non-fossil based power plants as well as setting up of charging infrastructure before the public adopts e-vehicles at large.

Also, ~~enough~~ ~~protection~~ clear guidelines on waste disposal must be laid for the sake of batteries that are to be used in e-vehicles. Otherwise it would cause more pollution to environment than the existing air pollution through CO emissions.
