

The occurrence of overlapping hazards pushes govt of India to the need for long-term preparedness along with multi-disciplinary approach. Explain.

India is facing multiple disasters, pandemic at one side and yearly occurring cyclones in eastern & western coast & flood in Ganga-Brahmaputra region.

As these hazards affecting the rebuilding of life & lives of people & economy of country it need long-term preparedness & multi-disciplinary approach.

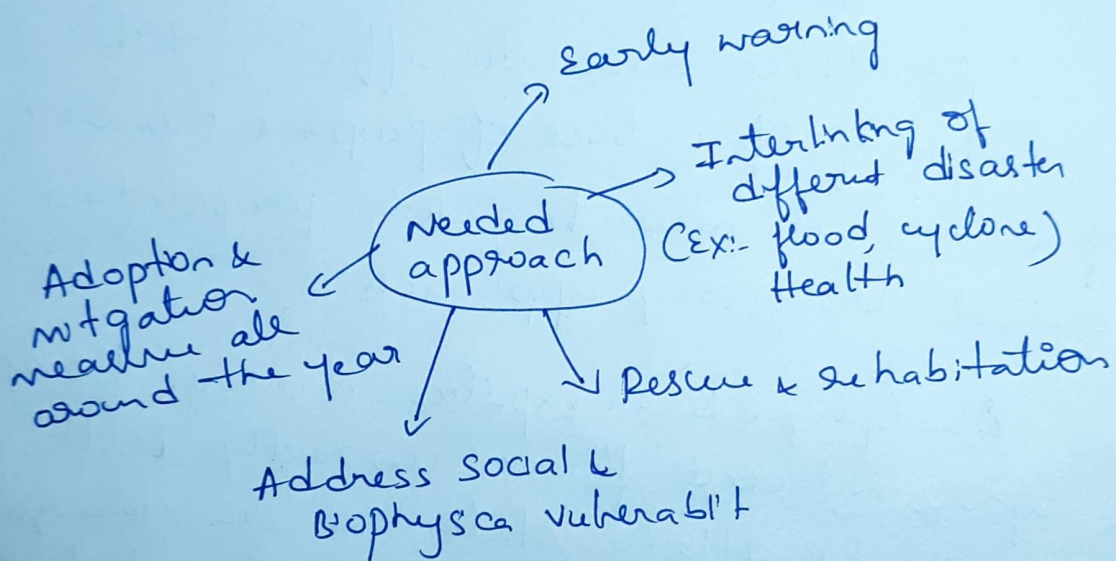

As Gang & Brahmaputra monsoon floods & cyclone induced floods currently dealt independently by different states however damage caused in loss of life, agriculture & infrastructure are intensified by these two events collectively.

Along with these floods follows communicable disease like dengue Malaria which add burden to worst pandemic.

Thus integrated multi disciplinary approach here necessary.

currently floods are focused only on rescue operation however people exposure to event of flood due to socio-economical cultural factors like lack of land, economic situation to more need to be addressed

with every natural disaster follows rescue & rebuilding, which results in Built forgot rebuilt syndrome thus need to be a long term preparedness like

National disaster Management

Authority need to reorient its strategies to deal with securing environmental disasters with long term all over the year strategies
